ABSTRACT / RESUME:

Japan delivered a VTS Simulator to Malaysia in May 2017.

This system is intended for the enhancement of the skills of VTS operators in ASEAN countries through the financial assistance of the Japanese Government (JAIF : The Japan-ASEAN Integration Fund). The main objective is to develop human resources to ensure the safety and security of marine traffic that is expected to increase in the region in the future.

This simulator system has the equipment configuration and functions that can execute various types of training that are required by IALA Recommendation V-103. This simulator enables in-service training that is required for VTS operators through the lessons necessary for acquiring the knowledge and by using the equipment that simulates the actual equipment.

This simulator system is equipped with the functions for executing training VTS operators at the novice stage. This system is introduced in this conference and we intend to make a presentation of function of the simulator, traing method and the expected effect of the training.
